December 15, 2023

We start this project by extracting the dataframe "BudgetItaly" from the "Ecdat" and extract the pfood column as it's asked using the commands:

```
library('Ecdat')
data(package = "Ecdat")
dat = as.data.frame(BudgetItaly)
dat <- subset(dat, select = -4)
```

Since we want to study the year 73 we create a different variable that only has that row so it's easier to compare visually the results using the command:

```
dat_73 <- dat[73,]"
```
